

A MEMO

building the delivery layer for cios

from product ideas to reliable fund delivery — why the team needs a second developer now.

PREPARED BY — NIKOLAI & NIKITA

cios is entering a new delivery phase.

- **green rock** and **chiron** are already aligning on evaluation metrics.
- we need to roll out concrete products for funds — beginning with the **evaluator**.
- cios is moving from internal building to external delivery.

A NOTE

this is no longer only a product-building effort — it is becoming a client-facing delivery system.

our limitation is delivery bandwidth — not ideas.

- nikolai has already designed multiple product interfaces and solutions.
- the target operating model is locked in.
- currently blocked because key technical capacity is split across too many functions.

3–5 days

idea to showable prototype

1–2 weeks

full validation loop with a fund

EVIDENCE

4 interfaces waiting for integration.

3 weeks of delay in testing the fast prototype cycle.

core ai / infrastructure work slowed by lms + payment + support.

A NOTE

we are not constrained by demand or product ideas —
we are constrained by execution capacity.

separate three functions currently overloaded into one workflow.

PERSON

nikolai

product discovery with funds

workflow analysis

solution design

demo / feedback / iteration loop

PERSON

nikita

core infrastructure

architecture

ai / backend / complex technical systems

TO HIRE

new hire

maintenance & reliability

productionization

integration support

fund-facing release support

A NOTE

the team does not need more help — it needs a correct functional split.

to charge funds, the system must be reliable and predictable.

funds will not pay for ideas alone. they will pay for the things that make ideas usable.

usable tools

predictable rollout

stable performance

ongoing maintenance

A NOTE

the new hire is part of the commercial model — not just part of the engineering team.

without a dedicated production / reliability layer, monetization is weaker and slower.

a fast product iteration engine across multiple funds.

with this setup, we can

move nikolai into his highest-value role

keep nikita focused on core technical leverage

establish a reliable shipping layer for releases

run weekly / biweekly validation cycles with funds

test products sequentially across 2–3 funds

target operating cadence

3–5 days

showable prototype

1–2 weeks

validated loop with a fund

hire one product / implementation engineer now.

ROLE FOCUS

maintenance and system operability

productionization of product interfaces

integration support

release support for fund-facing products

BUSINESS RATIONALE

unlock evaluator rollout

support green rock and chiron delivery

reduce overload on key people

build the delivery layer cios now needs

FINAL NOTE

without this role, growth is limited not by market demand — but by delivery bandwidth.
