
DELIVERY STRATEGY

Building the Delivery Layer for CIOS

From product ideas to reliable fund delivery — why we need a second developer now.

01 — CONTEXT

CIOS is entering a new delivery phase

- **Green Rock** and **Chiron** are already aligning on evaluation metrics.
- We need to start rolling out concrete products for funds, beginning with the **evaluator**.
- CIOS is moving from internal building to external delivery.

CORE MESSAGE

This is no longer only a product-building effort. It is becoming a client-facing delivery system.

02 — PROBLEM

Our limitation is delivery bandwidth, not ideas

- Nikolai has already designed multiple product interfaces and solutions.
- The target operating model is locked in.
- This model is currently blocked because key technical capacity is split across too many functions.

3–5 days

Idea to showable prototype

1–2 weeks

Full validation loop with a fund

EVIDENCE

4 interfaces waiting for integration.

3 weeks of delay in testing the fast prototype cycle.

Core AI / infrastructure work slowed down by LMS + payment + support work.

CORE MESSAGE

We are not constrained by demand or product ideas. We are constrained by execution capacity.

03 — SOLUTION

Separate three functions currently overloaded into one workflow

PERSON

Nikolai

- Product discovery with funds
- Workflow analysis
- Solution design
- Demo / feedback / iteration loop

PERSON

Nikita

- Core infrastructure
- Architecture
- AI / backend / complex technical systems

TO HIRE

New hire

- Maintenance
- Reliability
- Productionization
- Turning product interfaces into production-ready releases

CORE MESSAGE

The team does not need “more help.” It needs a correct functional split.

04 — COMMERCIAL

To charge funds, the system must be reliable and predictable

- Funds will not only pay for ideas.
- They will pay for:
 - Usable tools
 - Predictable rollout
 - Stable performance
 - Ongoing maintenance
- Without a dedicated production/reliability layer, monetization is weaker and slower.

CORE MESSAGE

**The new hire is part of the commercial model
— not just part of the engineering team.**

05 — OUTCOME

A fast product iteration engine across multiple funds

With this setup, we can

- Move Nikolai into his highest-value role.
- Keep Nikita focused on core technical leverage.
- Establish a reliable shipping layer for releases.
- Run weekly / biweekly validation cycles with funds.
- Test products sequentially across 2–3 funds.

Target operating cadence

3–5 days

Showable prototype

1–2 weeks

Validated loop with a fund

CORE MESSAGE

This hire increases speed, quality, and monetizable throughput at the same time.

06 — DECISION

Hire one Product / Implementation Engineer now

ROLE FOCUS

- Maintenance and system operability
- Productionization of product interfaces
- Integration support
- Release support for fund-facing products

BUSINESS RATIONALE

- Unlock evaluator rollout
- Support Green Rock and Chiron delivery
- Reduce overload on key people
- Build the delivery layer CIOS now needs

FINAL MESSAGE

Without this role, we are limiting growth not by market demand, but by delivery bandwidth.
