

internal cios · delivery v0.1

building the delivery layer for cios

from product ideas to reliable fund delivery — why the team needs a second developer now.

TOPIC

team capacity & fund-facing delivery

AUDIENCE

cios leadership

DECISION NEEDED

approve hire — product / impl. engineer

LENGTH

6 sections · ~7 min read

01 | CONTEXT | WHY NOW

cios is entering a new delivery phase.

FUNDS
ALIGNED

2 · FIRST
PRODUCT

evaluator · PHASE

internal →
external

01 **green rock** and **chiron** are already aligning on evaluation metrics.

aligned

02 we need to roll out concrete products for funds — beginning with the **evaluator**.

in flight

03 cios is moving from internal building to external delivery.

shift

NOTE

this is no longer only a product-building effort — it is becoming a client-facing delivery system.

02 • DIAGNOSIS • THE BOTTLENECK

our limitation is delivery bandwidth — not ideas.

01 nikolai has designed multiple product interfaces and solutions.

02 the target operating model is locked in.

03 currently blocked — key technical capacity is split across too many functions.

blocker

TARGET — PROTOTYPE

3–5 days

idea to showable

TARGET — FULL LOOP

1–2 weeks

validation with a fund

EVIDENCE

delivery

04 **interfaces** waiting for integration.

3w **delay** in testing the fast prototype cycle.

↓ core ai / infrastructure slowed by lms + payment + support.

DIAGNOSIS

we are not constrained by demand or product ideas — we are constrained by execution capacity.

03 | PROPOSAL | FUNCTIONAL SPLIT

separate three functions currently overloaded into one workflow.

PERSON

discovery

nikolai

product discovery with funds

workflow analysis

solution design

demo / feedback / iteration loop

PERSON

core

nikita

core infrastructure

architecture

ai / backend

complex technical systems

TO HIRE

delivery

new hire

maintenance & reliability

productionization

integration support

fund-facing release support

PROPOSAL

the team does not need more help — it needs a correct functional split.

04 | COMMERCIAL | MONETIZATION

to charge funds, the system must be reliable and predictable.

funds will not pay for ideas alone. they will pay for the things that make ideas usable.

usable tools

predictable rollout

stable performance

ongoing maintenance

without a dedicated production / reliability layer, monetization is weaker and slower — and pricing power stays low.

POSITIONING SHIFT

commercial

a **ideas only** — weak monetization, slow rollout.

today

b **ideas + delivery** — predictable, charge-ready.

target

NOTE

the new hire is part of the commercial model — not just part of the engineering team.

05 | OUTCOME | OPERATING CADENCE

a fast product iteration engine across multiple funds.

WITH THIS SETUP, WE CAN

- 01 move nikolai into his highest-value role.
- 02 keep nikita focused on core technical leverage.
- 03 establish a reliable shipping layer for releases.
- 04 run weekly / biweekly validation cycles with funds.
- 05 test products sequentially across 2–3 funds.

TARGET OPERATING CADENCE

PROTOTYPE

3–5 days 

idea to showable prototype

VALIDATED LOOP

1–2 weeks 

full validation cycle with a fund

OUTCOME

this hire increases speed, quality, and monetizable throughput at the same time.

06 | DECISION | THE ASK

hire one product / implementation engineer — now.

ROLE FOCUS

- 01 maintenance and system operability
- 02 productionization of product interfaces
- 03 integration support
- 04 release support for fund-facing products

BUSINESS RATIONALE

- a unlock evaluator rollout unblock
- b support green rock and chiron delivery enable
- c reduce overload on key people capacity
- d build the delivery layer cios now needs strategic

FINAL NOTE

without this role, growth is limited not by market demand — but by delivery bandwidth.
